

# Water & Tourism Nexus

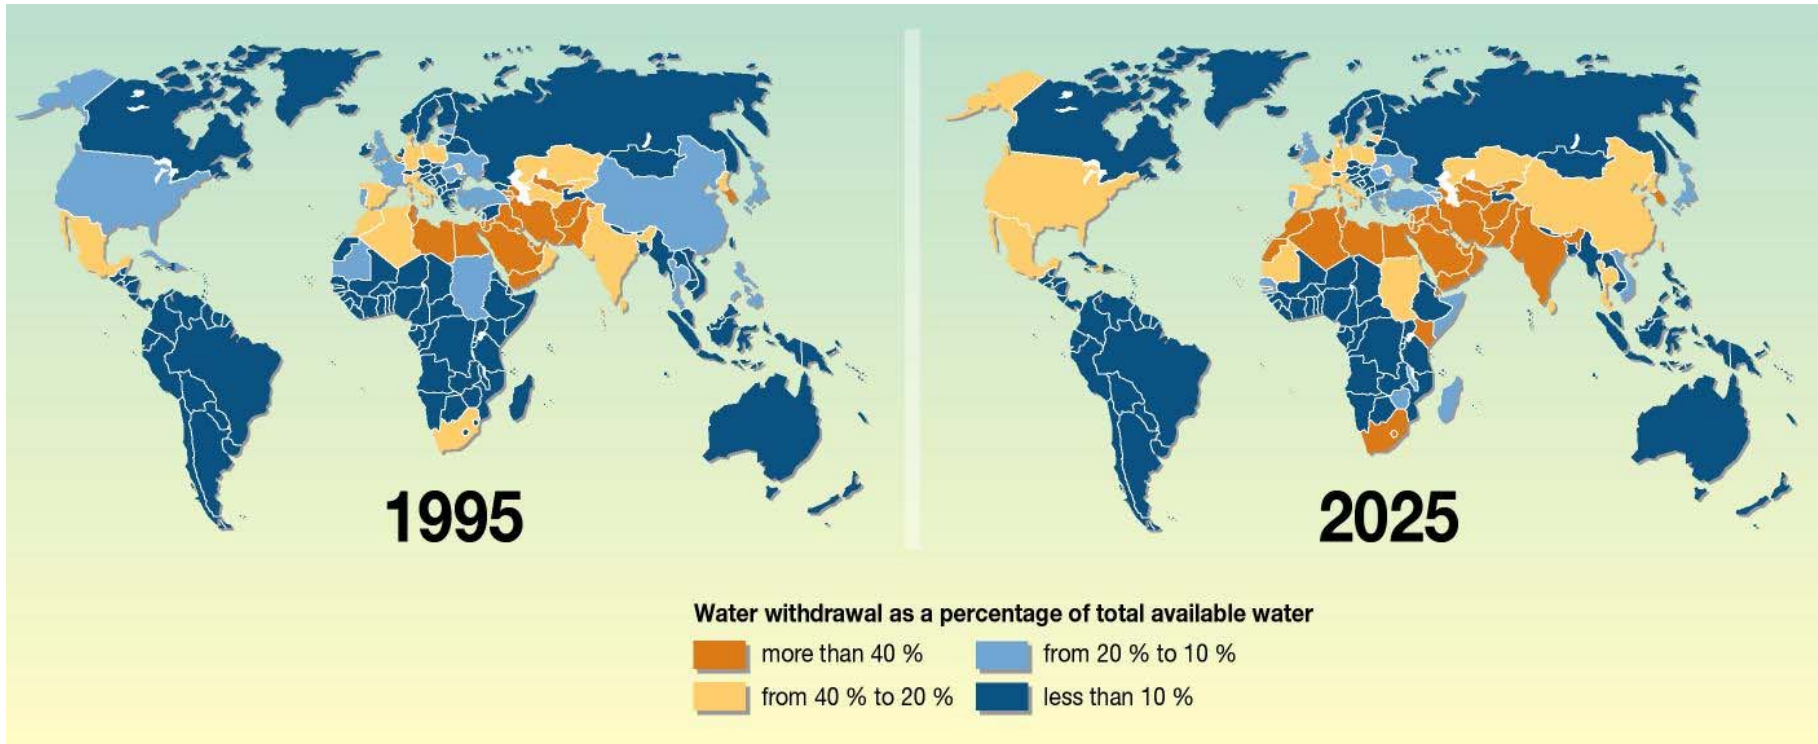

## Achieving Sustainability Through Water Reuse

Dr Valentina LAZAROVA  
Barcelona, May 17<sup>th</sup>, 2017

An adequate supply of good-quality water is  
a pre-requisite for economic and social progress

# Water Under Pressure: Hydric Stress in the World

Water needs in the world –  
70% agriculture, 20% industrial, and 10% drinking water

# Water Under Pressure: Hydric Stress in the Mediterranean Region

# Three Types of Water Challenges:

## Quantity

- By 2025, 2 billion people will be living in countries or regions with absolute water scarcity

## Quality

- Only 20% of wastewater effluents are adequately treated (UNESCO)

## Affordability

- Designing specific pricing policies and social measures to guarantee this right to low income households

**We have to adopt new ways of doing things, change our consumption habits and encourage the implementation of new solutions to imagine alternative water resources**

# Water & Tourism Nexus

## New Water Management Challenges

Securing the various water uses

Solving water & energy nexus

- Water is critical resource for tourism
- Water scarcity threatens tourism industry
- Tourism industry is key element for economic development in Islands and coastal areas with increasing water scarcity
- Sustainable water management is critical to secure a future for tourism

**40%** of municipal and industrial water needs will not be met in 2030

# Water & Tourism Nexus

How to control business risks and mitigate climate change impacts?

**Develop adequate site-specific water risk management plans** (well adapted to local conditions)

**Apply holistic approach to water management** to sustain desirable quality, efficiency, effectiveness and economic viability

**Diversify your water portfolio** with higher reliance on alternative resources,

e.g. water reuse and recycling, desalination, rainwater harvesting...

- Desalination is recognized as a main source for reliable and drought-proof supply in costal areas
- Wastewater treatment and reuse are becoming key components of circular economy for resource recovery and production of drought-proof recycled water

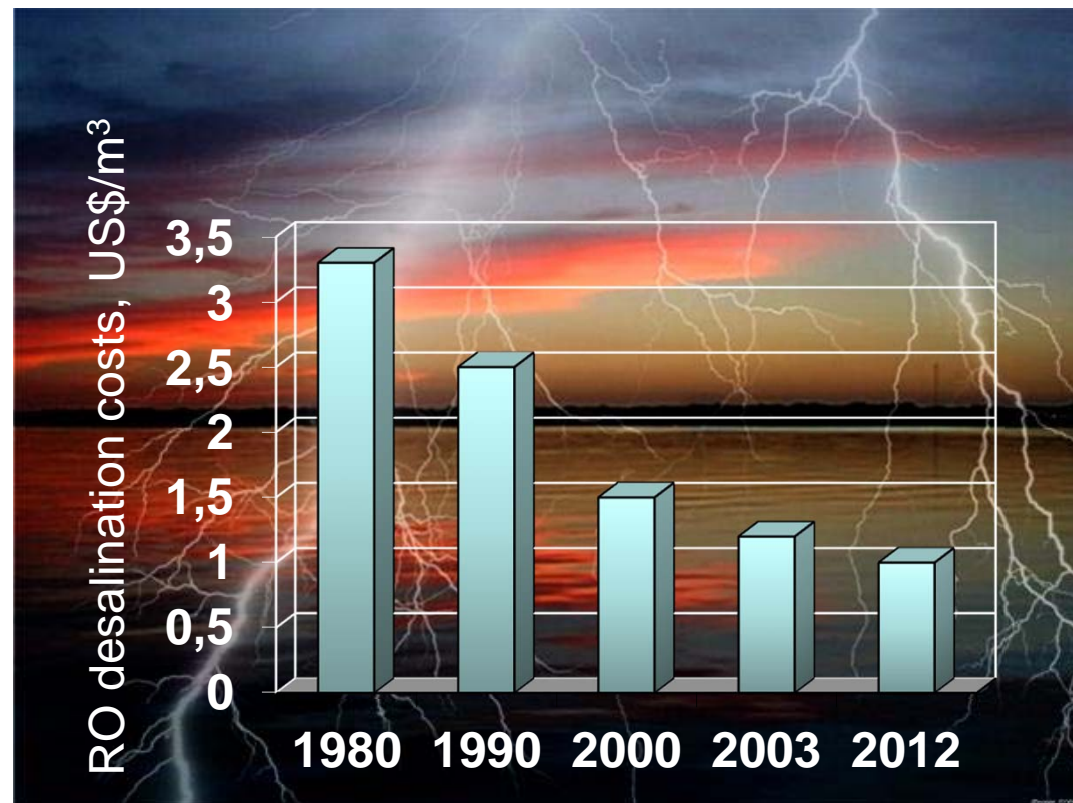

## Address Water-Energy Nexus

# Sustainable Water Cycles

How can technology and innovation create sustainability?

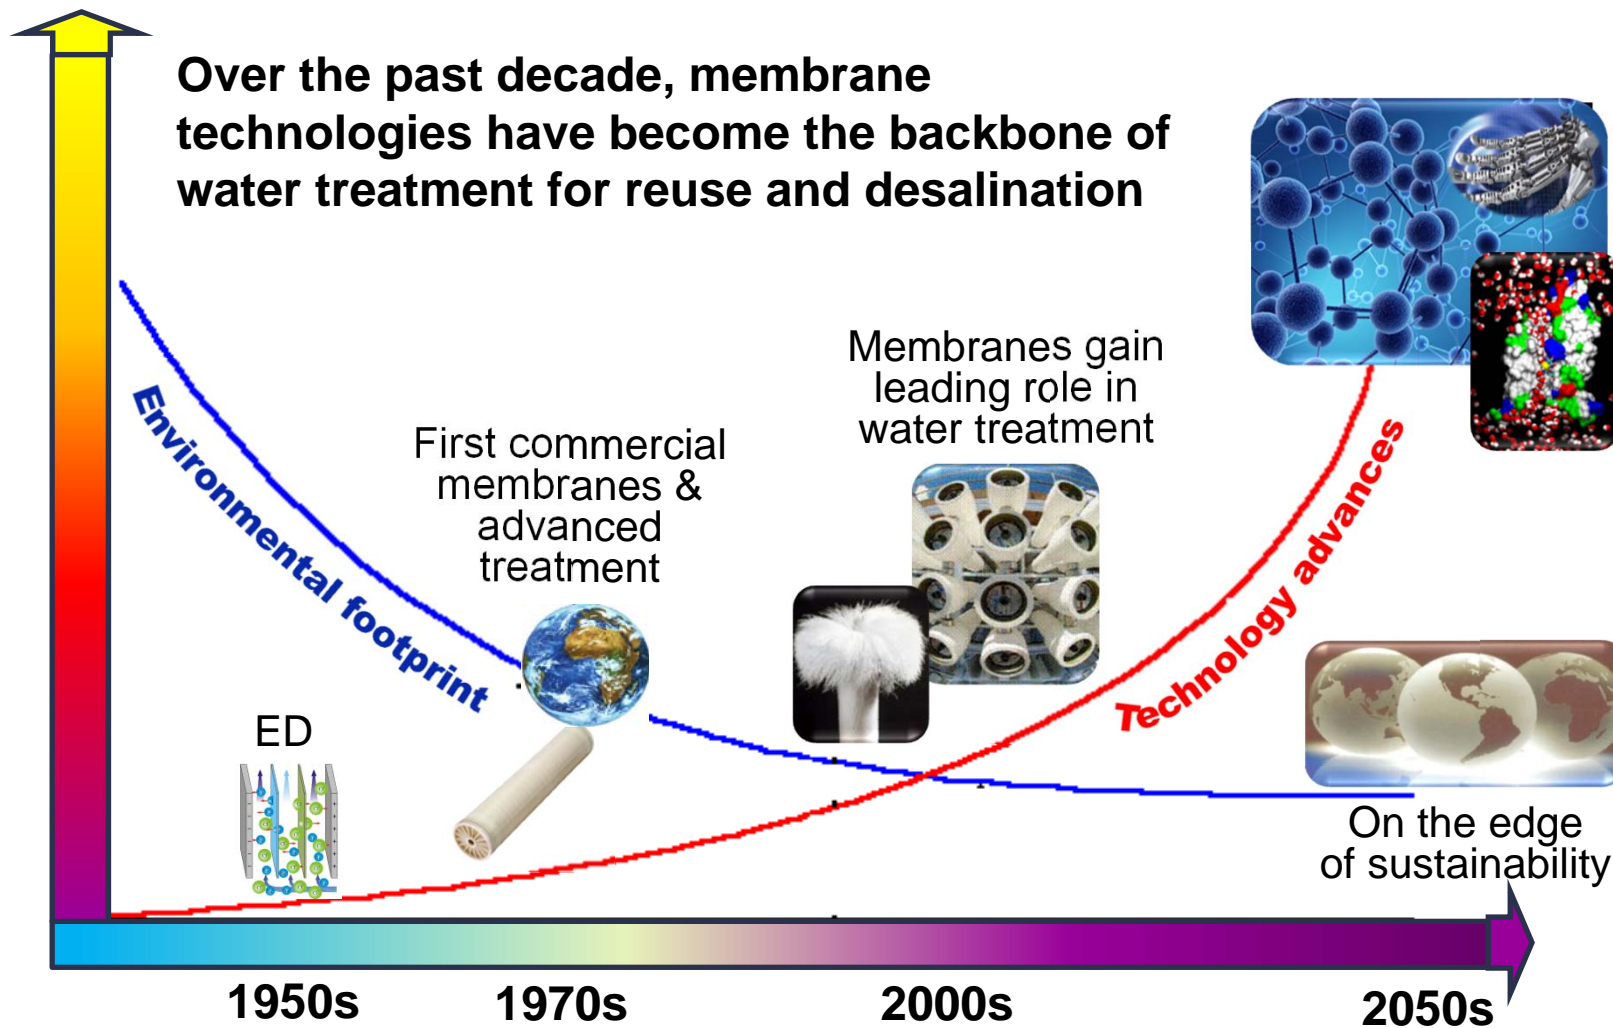

**Latest water treatment technologies allow to accelerate industrial production and recover valuable by-products at competitive cost**

- **Paradigm shift in technology and materials**
- **Green solutions**
- **Advance in membrane technology**
  - ✓ Reduction of membrane costs
  - ✓ High standardization and commoditization of RO membranes
  - ✓ Energy recovery

# Sustainable Water Cycle

## New challenges and new solutions

# Status of Water Reuse in Europe

## Key figures of water reuse

- Water reuse volume: 1 billion m<sup>3</sup>/yr (1 km<sup>3</sup>/yr)
- ~2.4% of the treated urban wastewater effluents
- <0.5% of annual EU freshwater withdrawals

## Water reuse potential

- 6 billion m<sup>3</sup>/yr

## European strategy and policy on water reuse

- Main policy objective:** to encourage efficient resource use and reduce pressures on the water environment
- Water reuse is a **top priority area** in the Strategic Implementation Plan of the European Innovation Partnership on Water
- Maximisation of water reuse is a **specific objective** in the Communication "Blueprint to safeguard Europe's water resources"

## Main barriers of water reuse

- Regulatory concerns** associated with process and water quality monitoring, as well as health risk assessment and management
- Relatively high cost** of water reuse compared to conventional water supply
- Public acceptance and health liability

# Keys to Success of Water Reuse in Tourist Areas

- Political awareness: incentives of the Bora Bora's Major
- Policy of sustainable development
  - « Blue Flag of Europe »
  - 1<sup>st</sup> Price of SUEZ 2005 Innovation Trophies

## Case Study: Bora Bora

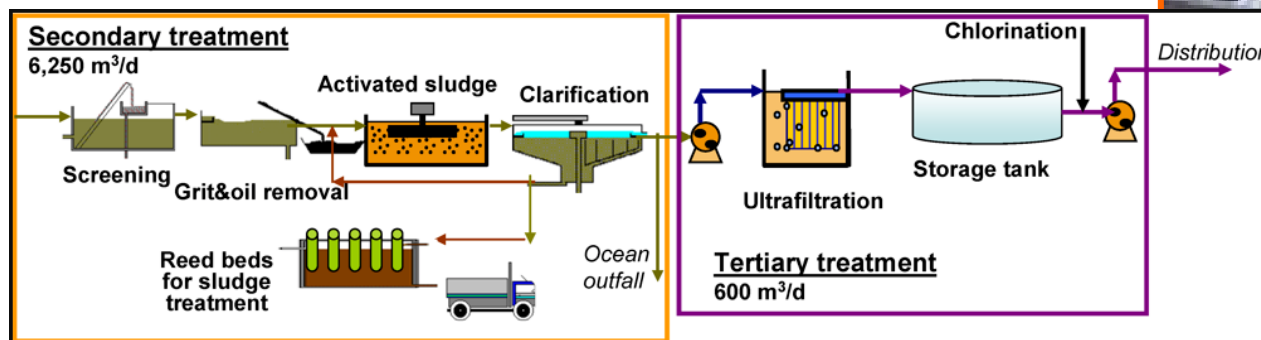

# Bora Bora Touristic Island

- An unique and fragile environment to protect with sustainable and efficient solutions
  - ✓ 8,000 inhabitants + 200,000 tourists a year
  - ✓ The best of the image of French Polynesia
  - ✓ LUXURY Hotels and HIGH STANDARDS requirements from the tourism market

# Driving Factors for Water Reuse in Bora Bora

- Water stress and increasing water demand
- Motivation of the municipality to protect water resources
- Strong community engagement
- Close cooperation between the stakeholders
- Adequate choice of the treatment technology and the ability to provide high-quality recycled water without any interruption

# Recycled Water End-Users in Bora Bora

- Luxury hotels, mostly landscape irrigation, water falls, water bodies
- Boat washing
- Washing of construction engines and pressure tests of concrete
- Fire protection (boats)

# Keys to Success of Water Reuse in Bora Bora

## 1. Strong political engagement

- The water reuse program in Bora Bora is an element of the global strategy of decision makers of integrated resource management
- Motivation of the elected representatives (leading role of the mayor)

# Keys to Success of Water Reuse in Bora Bora

## 2. Financial Incentives: pricing of recycled water

- Participation and satisfaction of end user
  - ✓ The cost of high-quality recycled water = 2.5 to 3 times less expensive than potable water
  - ✓ Large users such as luxury hotels were the first to recognise economic benefits of water reuse
- Declining rate structure
  - ✓ Fixed annual charge of 187 € by connection

Parameter	Criteria	First block	Second block	Third block
Volume for large users, m <sup>3</sup> /month	>350 m <sup>3</sup>	<550	550 to 800	>800
Recycled water charge, €/m <sup>3</sup>		2.35	2.18	1.65
Volume for medium users, m <sup>3</sup> /month	<350 m <sup>3</sup>	<110	110 to 200	>200
Recycled water charge, €/m <sup>3</sup>		1.16	1.08	0.88
Volume for small users, m <sup>3</sup> /month	<30 m <sup>3</sup>	<5	5 to 10	>10
Recycled water charge, €/m <sup>3</sup>		0.76	0.71	0.67

# Keys to Success of Water Reuse in Bora Bora

## 3. Involvement and collaboration of all stakeholders

# Keys to Success

## 4. Public education and communication

- Newspapers, TV, public meetings

Le Dépeche Jeudi 15 novembre 2009

**BORA BORA - Séminaire sur la gestion de l'eau, pour préserver la ressource**

### Eau potable : 8 % de l'eau utilisée

**U**n déficit chronique, notamment en période d'été, a conduit à la mise en place d'un plan de gestion de l'eau. Pour préserver la ressource, les autorités ont décidé de réduire de 20% la consommation d'eau. Les habitants ont été sensibilisés par des campagnes de communication. Les techniques modernes de traitement de l'eau, comme la filtration à sable et la désinfection par le chlore, ont permis de garantir la qualité de l'eau. Les autorités ont également mis en place des programmes de recyclage de l'eau et de réduction des déchets. Les citoyens ont été encouragés à utiliser des produits éco-citoyens et à économiser l'eau. Les autorités ont également mis en place des programmes de sensibilisation de l'environnement. Les citoyens ont été encouragés à utiliser des produits éco-citoyens et à économiser l'eau. Les autorités ont également mis en place des programmes de sensibilisation de l'environnement.

**Et 40% pour les toilettes...**

Pour Sébastien Lazarova, expert en traitement et utilisation des eaux usées dans le plus grand centre de recherche privé dans le territoire de l'île, cela "serait tout à fait normal". "Pour nos normes de pollution locale, il

**BORA BORA - Le recyclage des bouses permet d'obtenir un excellent terreau pour l'agriculture**

### Compost à profusion

**Le compostage biologique permet de transformer les déchets organiques en un produit riche en matière organique et en nutriments. Ce processus naturel permet de réduire la pollution et d'améliorer la fertilité des sols. Les agriculteurs peuvent utiliser ce compost comme engrais naturel pour leurs cultures. Les habitants peuvent également utiliser ce compost pour enrichir leurs jardins. Le compostage est une pratique écologique et économique qui contribue à la préservation de l'environnement.**

# Case Study: Sainte Maxime

# Keys to Success of Water Reuse in Sainte Maxime

1. Political awareness and subsidies
  - ✓ Subsidies from the General Council and Water Agency
  - ✓ Financial incentives (lower water price)
2. Reliable and sustainable operation
  - ✓ Public-private partnership
  - ✓ Proven and less expensive conventional tertiary treatment
    - Sand filtration + UV + Cl
    - Capacity of 2000 m<sup>3</sup>/d (25% of the total plant capacity)
3. Well demonstrated benefits
  - ✓ Saving of potable water – 12%
  - ✓ Saving of fertilizers – 20%

# Concluding remarks

## Major Challenges for Sustainable Growth of Water Reuse

### Adequate policy

- Converge regulatory frameworks
- Provide flexible legally binding framework taking into account local needs and feasibility for implementation
- Diversify water reuse applications

### Economic viability

- Implement appropriate water management policy and pricing
- Provide appropriate incentives (administrative, institutional and financing)
- Select proven, reliable and easy to operate technologies

### Public Perception

- Involve all stakeholders at early stages of the reuse project
- Improve communication and public education
- Frame best management practices

### Innovation in technology & monitoring

- Improve health safety through improved reliability and water quality control
- Support research and innovation

Develop sustainable water cycles and consider water reuse as a cost competitive and energy saving option to increase water availability

Each water drop is precious: so use water again safely and for the right purpose
